Subject Index

A

Abstracts
  2002 Transportation Science section dissertation competition, 223–229
Air transport industry
  applications of operations research, 368–391
  blind conflict risk factors under free-flight conditions, 457–470
  rerouting for airline recovery, 408–421
  schedule recovery problem during hub closures, 392–407
Airport arrival planning
  optimization-based analysis, 422–433
Algorithms
  branch-and-cut, 153–169
  bundle approach, aircraft schedule recovery, 392–407
Applications
  time-dependent, label-constrained shortest path problems, 278–293
Aviation operations
  special issue, commemorating 100 years of aviation, 365, 366–367

C

Contracts
  outsourcing logistics, 23–39

D

Distribution
  joint location-inventory model, 40–55
Driving cycles, 330–346
Dynamic traffic assignment capacity
  detecting paradoxes in saturated networks, 123–138

E

Emissions
  regional air quality vehicle emission inventories, 330–346

F

Freeway Queues
  transition zones, 312-329

I

In memoriam
  Ilya Prigogine (1917–2003), 255–256
Integer programming
  train-platforming problem, 213–222

M

Methodologies
  merge-in-transit operations, 1–22
Modeling
  airspace planning and collaborative decision-making model, 434–456
  joint location-inventory model, 40–55
  merge-in-transit operations, 1–22
  inhomogeneous kinematic wave traffic flow model, 294–311
  whole-link travel-time model, 83–96

N

Networks
  dynamic, revenue management, 257–277
  nondominated solutions for multiple objective programming problems, 139–152
  saturated, traffic assignment capacity paradoxes, 123–138
Nonlinear system, 294–311

O

Operations research
  air transport industry, 368–391
Optimization-based analysis
  collaborative airport arrival planning, 422–433
Outsourcing logistics
  designing transportation contracts, 23–39

P

Probability
  conflicts, workload, and equity considerations, 434–456
Problem-solving
  a practical pickup and delivery problem, 347–364
Properties
  random desirable properties, travel-time model, 83–96

Q

Queues
  real-time prediction of queue overflows, 97–119, 230–252
  transition zone behind freeway queue, 312–329

R

Railway timetabling
  cyclic, 198–212
Revenue management
  dynamic network environment, 257–277
Risk factors
  Blind conflict risk in en-route sectors, 457–470
Routing
  a practical pickup and delivery problem, 347–364
  capacitated vehicle routing problem, 153–169
  engine routing, in-plant railroads, 183–197
  rerouting aircraft for airline recovery, 408–421
  routing and scheduling with full truckloads, 170–182

S

Scheduling
  routing and scheduling with full truckloads, 170–182
  engine routing and scheduling at industrial in-plant railroads, 183–197
Sensitivity analysis
  aggregated variational inequity problems, 56–68

0041-1655/03/3704/0475
1526-5447 electronic ISSN

Shortest path problems
  time-dependent, label-constrained, 278–293
Solutions, nondominated
  multiple objective network programming problems, 139–152
Stochastic
  modeling of real-time prediction of queue overflows, 97–119, 230–252
  vehicle routing, 69–82

T

Traffic equilibria
  sensitivity analysis, 56–68
Train-platforming problem
  integer programming, 213–222
Travel times, 69–82
  whole-link model, 83–96
  variable trip time model, 198–212
